Description

The REST request is incorrectly validated when the value of the mandatory parameter “email” contains the ‘!’ character in the local part and has the domain “mail.ru”.

The REST response body includes the parameters “name”, “password”, and “email”.

The values of “email” and “name” match the values from the request body, while “password” is returned as a hash.

Steps To Reproduce:

1. Create key-value pairs in which the keys represent the required parameters, the values are unique, and the value of the “email” key includes the “!” character in the local part.
2. Send the REST request.

Actual results:

The REST response is returned. The response body contains the keys “name”, “email”, and “password”. The values of the “email” and “name” keys match the values from the request body, while “password” is returned as a hash.

Expected results:

The REST response is returned. The response body contains the key “message” with the value “Некорректный email ...”.
